

SMM has improved management information system by providing canned and customizable reports concerning collection and database use, circulation, workflow workload statics and automatically generating periodic notice for fine and overdue lust and recalled materials.

An integrated library system is an enterprise level software package that manages, integrates, and centralized multiple core library functions and services.

Our college library function (ILS) are designed to help libraries with three primary duties:

1. Increased operational efficiency
2. Provide access to library access
3. Provide access to extend resources

ILSs are considered to be the control nervous system of library automation and typically include several discrete but integrated modules; acquisitions, cataloguing, circulation, OPAC and reservation of documents.

The system are quite complex and bring together a wide variety of records for use in a single transaction.
